1.6 OWIN Integration

If you are using both of ASP.NET MVC and ASP.NET Web API in your application, you need to add StudioX.Owin project (generally, to the Web project) and call UseStudioX() extension method in your OWIN Startup file as shown below:

```
[assembly: OwinStartup(typeof(Startup))]
public class Startup
{
    public void Configuration(IAppBuilder app)
    {
        app.UseStudioX();
        //your other configuration...
    }
}
```

If you are only using OWIN (say, in a self hosted Web API project), you can use override of UseStudioX which takes a startup module to initialize StudioX framework. Notice that; this should be done only if StudioX is not initialized in another way.
